

Secure Direct Database Access

centralized management | user & role access controls | permission delegation

INCREASE SECURITY & SIMPLIFY ACCESS MANAGEMENT

DEVOPS & SECURITY ADMINISTRATOR

Need to lockdown use of shared credentials?

Need to provision temporary access for external contractors?

Want a single multi-factored login to connect to all cloud and on premise databases?

COMPLIANCE & GOVERNANCE

Need to apply data privacy & masking rules to all SQL access?

Want connection and SQL activity monitoring?

Need to comply with security and data privacy regulations?

Want all this without changes to your servers, directories or client operations?

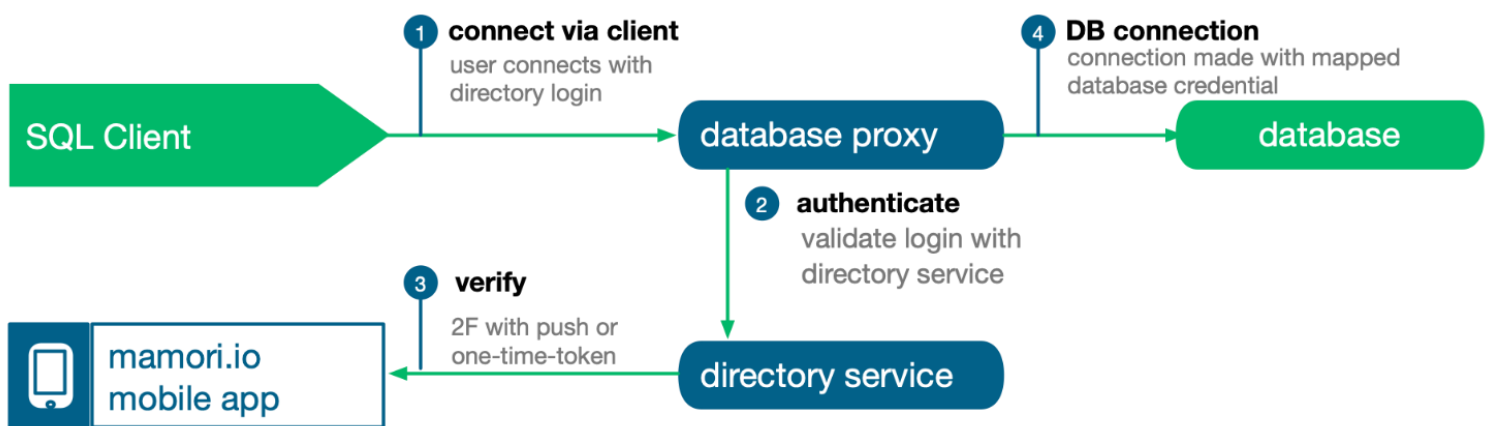

THE MAMORI SOLUTION

Database Proxy – database access controls

With the mamori database proxies you can quickly implement secure multi-factored access to your existing databases. The proxies authenticate logins with both the configured directory and 2FA provider, connect with the mapped credentials and then apply any data privacy policies to session statements.

- Users keep using native tools like Oracle SQLPlus and SQL Server Management Studio.
- Users use multi-factored directory logins instead of database credentials to connect to databases.
- Granular delegation and control over SQL, object permissions and data masking
- Capture all SQL for auditing
- Users can use the mamori mobile app to request temporary elevated permissions to databases, objects and reveal masked data.

Client Connection Workflow

Key Benefits

Simple cloud or on premise installation. No changes to your servers, directories or client operations.

Built in multi-factored authentication.

(mobile push & one time passwords)

Access databases directly using standard tools and drivers. No need for painful virtual desktop sessions.

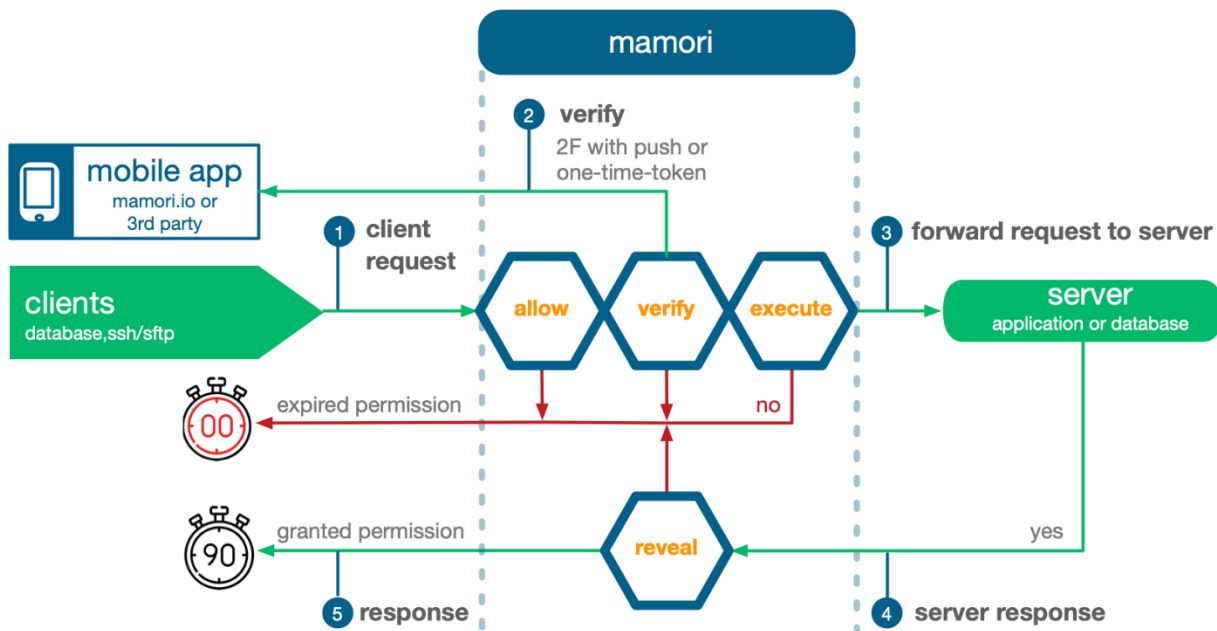

Out of the box geo encoded access threat map.

Secure Direct Database Access
